**Abstract**

The invention concerns a unit with a microphone part and an ear-headphone part. The ear-headphone part is intended to be arranged at or held against the ear of a user while the microphone part is intended to be arranged near the user's mouth. The unit can be connected to a computer in order to enable conversational communication via the computer. The computer may also have a built-in loudspeaker or can be connected to a loudspeaker which can be a desk or floor loudspeaker. The unit has a switching member. In a first switching state, the unit is connected for use for conversational communication. In a second switching state, at least said ear-headphone part is not active while said desk or floor loudspeaker or built-in loudspeaker is active. The invention also concerns a computer system comprising a unit according to the above.
